Quiz: Setting Up Selenium

1. How does python manipulate the web browser?

   a. By using `pip install selenium` python can manipulate the browser directly

   b. **A separate webdriver must be installed through which the python selenium library can manipulate the browser**

   c. Python uses the urllib library to connect to the browser and manipulate it.

2. Who maintains webdrivers as of Selenium 3?

   a. The SeleniumHQ Team

   b. **The browser vendors**

   c. The Open Source community

3. Where does Selenium 3 look for webdriver binaries/executables by default?

   a. There are no default locations. Because every system is different, the path must be provided when initializing the driver.

   b. C:\ drive for Win32 systems, /usr/local for Mac and Linux

   c. **Selenium 3 uses the system's PATH environment variable to locate webdriver binaries/executables**

4. Python and the selenium library are all that is needed to automate a web browser.

   a. True

   b. **False**
